## Statement

The FEMM Foundation is a knowledge-based health programme for women inspired by women's right to be informed participants in their own health care and to make voluntary decisions based on options, information, and understanding. The FEMM Foundation is dedicated to health education, medical research, and improving reproductive health care to advance women's health. Women and girls do often not receive quality health care; the FEMM Foundation is dedicated to addressing these health disparities to help truly empower women and girls and achieve gender equality.

The Beijing Declaration and Platform for Action reflected a commitment to women's health, including reproductive health. The Sustainable Development Goals echo this in the targets under Goal 3: Good Health and Well-being. These reflect international law, which recognizes a right to the "highest attainable standard of health". This is important not only as a right but as an enabler of participation in the social and economic life of one's community, also making informed choices about family planning and a healthy lifestyle are key to reaching gender equality and women's and girls' empowerment. This requires sustainable health infrastructures and services that address women's unique health needs, including their reproductive health. This, in turn, will empower women and girls and promote their equal participation in all spheres of life.

Women and girls comprise approximately half of the population of the world, but remain more vulnerable to health problems due to biological and social reasons. Health can help or hinder women's and girls' education and participation in the social and economic life of their communities, which are essential aspects of achieving gender equality and empowerment. By implementing good health care for women and girls, we can ensure that they are able to develop their gifts and contribute to their families, jobs, and societies.

The Beijing Declaration and Platform for Action notes that there is a right to informed consent within health care (paragraph 93). This also applies within a reproductive health context, where women deserve to make decisions on the basis of options, information, and understanding. Understanding one's own body is essential for good health and empowers women and girls to be informed participants in their care.

Women also often accept as normal symptoms such as irregular bleeding, pain, depression, mood swings, and weight gain, not realizing that these are often signs of underlying hormonal imbalances and abnormalities. Even when women do seek medical care, most healthcare providers and programmes struggle to diagnose them and often can only treat the symptoms. Women and girls may not be able to reach a specialist who can help them.

These underlying conditions can affect women's and girls' long-term overall health, sometimes irreversibly. They can also affect their ability to complete their education, engage in work, and plan their families. These may interfere with their ability to participate in all areas of their lives. Poor health hurts gender equality by undermining women's and girls' ability to realize their potential and drive development in their communities. Women and girls who have untreated medical conditions can be empowered through both knowledge and good medical treatment.

A woman who understands how her body works can monitor her health and seek help when needed and make informed decisions about the care she receives. Even women who have not completed schooling can learn to monitor their health. Understanding women's bodies will also combat stigma and myths associated with normal biological processes such as menstruation.

The FEMM Foundation knows that hormones are essential to reproductive and overall women's health. Ovulation is a sign of health in women because it is the proof of sufficient hormone levels in the nine essential hormones that influence women's health. The FEMM Foundation teaches women to understand this information and the signs it presents in their bodies. This way, women using FEMM are able to identify abnormalities as they arise, seek health treatment when necessary, and ensure that their symptoms or complaints are not dismissed.

The FEMM Foundation also enables women to make informed choices about family planning. There is a right to adequate family planning and information about reproductive and sexual health that is accurate and respects cultural, religious, and ethical beliefs. Programmes focused on providing commodities often fail to ensure that women have the education needed to understand their bodies and what they are using, and may not always respect values. Commodities also run out, whereas knowledge, once acquired, is there to stay, and can be shared freely.

Information-based health education and medical care is uniquely well suited to meet these needs while respecting individual choices and values. The FEMM Foundation offers reproductive and hormonal education and helps women to understand the way various family planning methods work and their potential side effects. It educates women about the science of their bodies, how to identify when they are fertile, and how to achieve or avoid pregnancy.

The FEMM Foundation has also developed an app to help women take control of their health. The FEMM Foundation application is available free of charge. It is now available in English and Spanish and on both Apple and Android devices, making it available to more women around the world, with many new downloads coming from women in developing countries. Women who use the FEMM Foundation application can track their observations and symptoms to better understand their bodies and health. Just as each woman is different, so are her observations and experiences, which is why the application is completely customizable. Women can track as much or as little as they like, and add symptoms and observations. It also provides insights into what a woman is experiencing in her cycle, and can flag potential health concerns and connect women with medical professionals for treatment.

Women and girls also need good health care when they identify health concerns. The FEMM Foundation's Medical Management programme trains doctors to diagnose and treat reproductive health problems, with a holistic view of a woman's body that incorporates recent research on the complex hormonal interactions between different body systems. This interaction, and the delicacy of the hormonal activity in a woman's body, is essential to the experience of health in the entire female body. The FEMM Foundation has developed innovative protocols that allow doctors to identify underlying problems with precision and treat them effectively. This medical support provides treatments that help women to live healthy lives.

The FEMM Foundation applications is low-cost and meets the underlying needs of women. Comprehensive health care for women can now be provided through basic health delivery systems, making this approach to women's health more effective, cheaper to deliver, and providing better health outcomes. This makes the FEMM Foundation application a sustainable way of incorporating advanced endocrinological care into healthcare infrastructures. By incorporating this care into other efforts, we can ensure that women and girls get the care they deserve and which will help them participate fully in their communities.

Women's and girls' equality and empowerment requires the investment in women's health and health education. Women's health care has often failed to meet women's needs. We know that informed decisions lead to healthier decisions, and that women play a key role in family and community health outcomes. Through the

FEMM Foundation's innovative programmes, women and girls will take charge of their health, empowering them to reach their potential and build a world where gender equality is realized. We call on the Commission on the Status of Women to ensure that authentic health care is included in social protection systems and public services, and we are ready to help.
